LEFT BLANK ON PURPOSE

A. Attributes of Growth Corridor Boulevards

Growth Corridor Boulevards are critical roadways that connect centers of activity. They are located along Montgomery County's major transit corridors and outside of Downtowns and Town Centers. Buildings are located close to the street and offer a blend of places to live, work, shop, and visit. Development density is varied, ranging from high- to medium-intensity. Pedestrian and bicycle activity is moderate to high. For this reason, street design includes elements that slow vehicle traffic, facilitate safe crossings and transit access for pedestrians, and provide visual cues to drivers that more pedestrian and bicyclists may be present. Growth Corridors Boulevards can be applied to Growth Corridors identified in *Thrive Montgomery 2050* or through an area master plan or functional plan if the vast majority of the segment is recommended to be zoned a mix of moderate and high density and where a grid of streets with frequent intersection spacing is recommended.

Key Features:

- Development intensity: High to moderate residential, mixed-use, or retail
- Pedestrian and bicycle activity: High to moderate
- Vehicle activity: High to moderate
- Transit service: Premium transit service including Metrorail and / or light rail / or bus rapid transit in dedicated lanes
- On-street parking: Uncommon
- Other key features: Infrequent driveways, street trees

Growth Corridor Boulevard Examples

Figure 1: Richmond Highway, Alexandria, Virginia

Table 1: Corridor Design Parameters for Growth Corridor Boulevards

Design Parameter	Design Guidance	Notes
Target Speed	30	Presence, proximity, and volume of pedestrians, bicyclists, passenger vehicles, transit vehicles, and commercial vehicles shall be considered when determining an appropriate target speed. State law requires a minimum posted speed of 25 mph outside of "urban districts" as defined in the law.
Maximum # of Vehicle Through Lanes	6	See Master Plan of Highways and Transitways for number of travel lanes on specific streets, which supersedes this guidance. These are primarily for new roads and when considering road diets.
Maximum Spacing for Protected Crossings	600′	Site-specific needs and conditions will dictate actual implementation.
Generally Accepted Minimum Spacing for Signalized Intersections	600′	Refers to a full signalized intersection or roundabout. These targets are intended to maintain operations at a level that promotes safe movement by all travel modes. Site-specific needs and conditions, as determined through the regulatory approval process or capital project review, will dictate actual implementation.

Table 2: Cross Section Design Parameters for Boulevards

Design Parameter	Design Parameter	Priority	Notes
Street Zone			
Center Median	6-16′	M	The dimensions shown apply only if a median is provided. Medians may be wider than dimensions provided in some circumstances. The median may be replaced or widened to include left turn lanes at intersections. If the street is planned for a median transitway: transit lane dimensions supersede. Consult MCDOT for detailed info.
Dedicated Transitway	Transitway lanes: 13′ default, 12′ min Transitway buffer: 6′ default, 2′ min	H	The presence of a dedicated transitway is determined in the Master Plan of Highways and Transitways. If these dimensions vary from those provided in a specific Transitway planning process, those dimensions supersede this document. Dimensions may vary at stations, intersections & other crossing points, and along horizontal curves.
Left-Turn Lane	10'	N/A	Dimensions only apply if a left turn lane is provided.
Two-Way Left-Turn Lane	N/A	N/A	Two-Way Left-Turn Lanes are not appropriate along this street type.
Inside Travel Lane	10'	N/A	Use the Outside Travel Lane dimension if there is only one lane per direction. Lane width dimensions are intended for typical tangent (straight) sections. Segments with

Design Parameter	Design Parameter	Priority	Notes
			vertical or horizontal curves may require wider pavements per Section 3.3.10 of the AASHTO Green Book.
Outside Travel Lane	11'	N/A	Lane width dimensions are intended for typical tangent (straight) sections. Segments with vertical or horizontal curves may require wider pavements per Section 3.3.10 of the AASHTO Green Book. If the outside lane is adjacent to a striped bike lane, the total width (travel lane + bike lane) should be no less than 16'. Guidance also applies to right turn lanes, where needed. Gutter pan is included in parking lane dimensions (below); however, if there is no parking lane, gutter pan is included in these dimensions for the outside travel lane.
Parking Lane	8'	L	Presumes parallel parking. Gutter pan is included in parking lane dimensions. If there is no parking lane, the gutter pan is already included in the Outside Travel Lane width.
Active Zone			
Street Buffer	8'	H	In constrained environments, the default Street Buffer width is a higher priority than the default Bikeway width. Where a lane within the Street Zone is converted to a street level separated bike lane, the Street Buffer may be reduced to 3' only when implemented by MCDOT as an interim bikeway. Where on-street parking is present, a minimum 3' door swing zone is required between the face of curb and any adjacent pedestrian or bicycle facility.
Bikeway	Two-Way Separated Bike Lanes on One Side; Sidepath on Other Side 11' default; 8' min	H	SBL = Separated Bike Lane. Default bikeway types apply to streets without master planned bikeways. The widths apply to master planned and non-master planned bikeways. If the Bicycle Master Plan recommends something different for a specific street, that supersedes this guidance. Dimensions do not include the street buffer or pedestrian/bicycle buffer (see below). If bikeway is at street level and adjacent to the curb, dimensions include the gutter pan. For corridors designated as Breezeways: the Priority is always High & see additional requirements in the Bicycle Master Plan.
Ped / Bike Buffer	6' default; 2' min	M	Provided only if a separated bike lane is provided.
Sidewalk / Sidepath	11' default; 8' min	H	Using the minimum dimension requires a waiver – consult MCDOT.
Frontage Zone	7' default, 0' min	M	Some or all of the frontage zone may occur on private property.
Maintenance Buffer	0'	N/A	Structures not part of the roadway design shall not occur in the public ROW. If there is a structure abutting the property line, a maintenance buffer is required even if this table shows a dimension of 0'.
